EDUCATION

University of Toronto

Sep. 2021 – April 2026

Honours Bachelor of Science, Computer Science & Mathematics (Double Major) + PEY Co-op

Relevant Coursework: Artificial Intelligence, Machine Learning, Computer/Info Security, Data Structures, Algorithms, Software Design, Cryptography, Operating Systems, Databases

TECHNICAL SKILLS

Languages: Python, Java, C, SQL, Bash, HTML, CSS/SCSS, TypeScript/JavaScript

Developer Tools: Git/GitHub/Bitbucket, PostgreSQL, Linux, Jenkins, Cloudflare Worker, Kali Linux

Technologies/Frameworks: NumPy, scikit-learn, JavaFX, React, Next.js

EXPERIENCE

SPIN VFX

May 2024 – May 2025

Software Developer Intern

Toronto, ON

- Automated VFX artist scheduling via **Python event listeners** integrated with **Autodesk Flow Production**, enabling near real-time propagation of task and assignment changes across multiple teams.
- Built a sprint planning tool using **Python Streamlit** and the **Jira REST API**, generating schedules for future sprints, reducing planning time by **50%**, and providing a high level overview of developers' tasks and targets.
- Modularized legacy **Python** scripts leveraging **rez package manager**, eliminating an efficiency bottleneck between development and releases for essential daily cron jobs, reducing error triage time from hours to minutes.
- Refactored legacy internal **Python packages** introducing robust API error handling, significantly reducing timeouts due to API errors on daily cron jobs.
- Eliminated the need for manual schedule updates using task-schedule synchronization, saving VFX supervisors **5+ hours per week** while reducing update latency from hours to seconds.

PROJECTS

Personal Portfolio Website | React, TypeScript, CSS/SCSS, Next.js

- Built a personal portfolio website using **React** with a focus on visual design and **responsive layouts**, resulting in a polished, mobile-friendly user experience across all screen sizes.
- Migrated the portfolio from a single-page client-side React/Vite architecture to a multi-page application using **Next.js** with server-side rendering to improve performance.

Letterboxd React Component | React, TypeScript, CSS/SCSS, Cloudflare Worker

- Developed and published an **open-source React component** to **npm** that surfaces a user's recently logged Letterboxd films, enabling any developer to embed recently logged activity into their personal site.
- Architected a **Cloudflare Worker** backend to proxy and cache Letterboxd RSS feed data on an hourly refresh cycle, eliminating direct client-side RSS calls and reducing redundant upstream requests.

City Prediction ML Model | Python, NumPy, scikit-learn

- In a team of four, trained a machine learning model to **predict cities** based on student survey responses about architecture, culture, temperature, and word associations.
- Researched and trained a variety of models including **k-NN, Random Forest, and Neural Network**, evaluating their effectiveness by comparing test results, confusion matrices, rates of convergence, and more.

BOGGLE 1.1 | Java, JavaFX

- Developed a full-featured **Boggle game** in a team of four, featuring an interactive GUI, multiple difficulty modes, and language and accessibility settings.
- Created **UML diagrams** to assist in implementing **object oriented software design patterns** to improve code structure, readability, and to provide options for future additions.

Computer Security | C, Python, Kali Linux

- Exploited vulnerabilities in software from **OWASP** using buffer overruns, race conditions, SQL injections, fuzzing, cross site scripting, and password hash cracking.
- Conducted **forensic computing** on a compromised virtual machine, identifying attack vectors and vulnerabilities.
- Extracted malicious communications through examining captured packets using **Wireshark** on **Kali Linux**.
